Research on the Practice of College English Teaching Reform Based on Digital Intelligence Teaching Model

I. Yoon, O. Harris, F. Miller

Abstract

The research focuses on the innovation of college English teaching mode driven by artificial intelligence technology, and uses the New Start College English Comprehensive Course and its supporting AI digital intelligence teaching platform as the practice carrier to build a whole-process intelligent teaching system. Through the five core functional modules of teaching support, learning support, teaching management, evaluation feedback, assessment and monitoring, the platform integrates AI technologies such as language analysis, intelligent scoring, and knowledge graph to achieve accurate push of teaching resources, efficient management of classroom interaction, real-time monitoring of learning behavior, and multi-dimensional intelligent evaluation. Teaching practice shows that through precise planning before teaching, dynamic interaction in teaching, and data-driven optimization after teaching, the AI-empowered closed-loop mechanism of "teaching - learning - managing - evaluating - assessing" has effectively improved the teaching quality and students' language ability, providing a smart teaching paradigm for the digital transformation of higher education.
